

The new approach in scalable application creation

You have ideas, yet no time to build them. Founda offers a new way to build applications.

It is a platform to create and run complex applications effortlessly. At its core, Founda is a framework that includes infrastructure.

At Founda we believe that you should focus on what makes your product unique.

We take care of all:

- SDKs
- Documentation
- API validation
- Analytics
- Monetization
- Caching
- And more...

Your application on Founda's framework

No code creator: there is no longer a need to learn how to code. With Founda, you can create new applications by drawing your business logic and speaking with our smart assistant Nina.

Low code creator: you can use the same tools as the no-code creator. When you need to dive deeper, you have full access to front-end and back-end code. You can also build locally using our CLI.

Benefits

Always in sync: Founda ensures that your SDKs, Docs, APIs and apps are always aligned.

No lock-in: migrate away to your own infrastructure anytime you want.

Deploy instantly: build an application using our framework and press a button to release it instantly - no need to wait.

Full IAM system: with OAuth2 out of the box.

Marketplace: no need to build everything from scratch, re-use existing (3rd party) components.

Analytics: to keep track of the users on your applications & the performance of your applications.

Developer friendly: access code at the lowest level to tweak what you want.

Release notes: simple tool to track changes and generate meaningful release notes.

API Creator

Serverless: your API will run on our high performance serverless infrastructure. If your application gains popularity, you don't have to worry about your application running into problems. Because we are serverless, we can scale quickly without having to manually get involved.

Versioning: we facilitate best practices including versioning (simple upgrades) that ensures your API, documentation, your apps & SDKs are always in sync. We give you full control over your version life-cycle.

Data storage: high performance, scalable databases for your API.

File storage: easy access to all the files your API or UI needs to run.

Staged releasing: we support the most robust dev-ops processes to ensure that your application will do what you promised your customers before it goes into production.

Built-in caching: we ensure high speed performance of your application for all your customers.

No - code

Mobile apps: create stunning native mobile apps without code using our drag & drop app designer.

Web apps: design beautiful websites with our intuitive web page creator.

API creator: create powerful APIs and business logic using a simple visual editor.

Nina: our smart assistant, backed-up by our implementation engineers, help you get your application up and running quickly.
