Founda

QA Engineer

Founded by seasoned tech entrepreneurs in February 2019, Founda is a young and well funded company in the health tech & low code / no code space in Amsterdam. We are a passionate group of creators eager to give the healthcare world the technology it requires, against a fair price. We believe money should go to the patient care instead of expensive suppliers with even more expensive lock-ins. Our mission is simple: we aim to make the healthcare world a better place. We plan on achieving this goal by creating tools that allow healthcare innovators to disrupt the healthtech space and improve the lives of billions.

We have been building a technology company using a modern stack with a small team of self-determined developers. We are looking to grow the company with high quality people.

Our technology stack: NodeJS, PostgreSQL, Vue (SSR), AWS (ECS), Docker. Our management tool is Jira. We are working on very exciting challenges within our microservices infrastructure, touching serverless, analytics, sorting algorithms, performance sql query tuning... and much more..

As a QA Engineer, you play a vital role in ensuring that our software meets the highest quality standards. Our customers include healthcare providers, which deserve the highest quality standards for software development. The role is exciting as it allows you to build the quality control process and system from the ground up. Hence, you lay the footprint of quality control for the whole organisation. As the software development at Founda grows at a high pace in this phase of the company/product, striking a balance between releasing quickly and meeting high standards are an important part of the job. As a candidate you will be responsible for ensuring quality of both front-end and back-end software.

This job is full-time.
You'll be based in our Amsterdam office, in the Netherlands. Our office is bilingual, communicating both in English and in Dutch. We are a diverse, international workplace, so anyone is welcome to apply!

As Founda is a young company, this role may evolve from doing the actual software testing (QA Engineer) to being end-responsible for overall product quality and eventually managing a team of testers/QA specialists (QA Lead/test manager).

Your responsibilities:
- Responsible for the overall quality of software delivery
- Test current products and identifying deficiencies
- Plan, create and manage the overall quality planning strategy. This needs to be built from the ground up.
- Collaborate with the development team to ensure consistent project execution
- Identify quality assurance process bottlenecks and suggest actions for improvement
- Identify KPIs for product quality

Founda

<u>What We're Looking For</u>
- Minimum of three years of professional experience as a QA Engineer. Experience in healthcare is considered a plus
- Experience with a variety of different testing methods such as UI testing, automated testing and test driven development strategies
- Experience with Javascript and/or Typescript, ideally in a NodeJS framework
- Experience with web security
- Experience with QA tools and processes
- A sense of ownership and pride in your performance
- Critical thinker and problem-solving skills
- Team player, time-management and communication skills

<u>What We Offer</u>
- An opportunity to use your skills to build tools that will improve the lives of billions
- An ambitious and motivated team in an inspiring, fast-paced international environment with backgrounds in healthcare, payments and IT
- Room to grow — support in developing your career and yourself
- A pleasant work space — a laptop, a second monitor, a comfortable desk, nice private kitchen
- An office on the canals of Amsterdam
- Close to Amsterdam Vijzelgracht Station
- Equity incentive package
- Competitive Salary

We are so excited to speak with you. Please drop us an email at hello@founda.com, subject line: QA Engineer.
